Model name: 3c_vgg16_dense128

Description and underlying idea:
In contrast to the previous model 3a_vgg16_dense512, the structure of the dense-layers is of the form 1024 -> 128 -> 4 in order to test, if more balanced steps are better for model performance.

Conclusion:
The results of the Covid class have improved once again. It seems that dense layers of the form 1024 -> 128 -> 4 perform better than 1024 -> 512 -> 4. However, we can also see some slight overfitting on this model.
Following another hint from our project mentor, we tested this model on other random pictures from the Internet.

Training History:
