

Model name: 2_vgg16_2-classes_dense512_masked

Description and underlying idea:

According to the Kaggle webpage VGG16 seems to be a promising candidate for classifying x-ray-images. We applied this to the masked images and classifying only the Covid and Normal class in our early experiments.

Conclusion:

The performance is much better than the Densenet121. This encouraged us to experiment further with the VGG16 approach. Btw, we can see from the training history difference between training and evaluation dataset, that the model overfitted. We need to take care about this in our further experiments.

Training History:

Performance Report / Recall normalized confusion matrix

	pre	rec	f1
normal	0.953536	0.919821	0.936375
covid	0.804612	0.880478	0.840837
