

Model name: 3b_vgg16_augmented_dense512

Description and underlying idea:

In this model, data augmentation is now applied for the first time taking the model 3a_vgg_dense512 as performance baseline in order to observe the effects on the model performance.

Conclusion:

Unfortunately, the results are quite poor. It is particularly noticeable that the test accuracy is significantly lower than the train accuracy, so the model well overfitted a lot. Based on the learning curve, it can be observed that the model reaches its final value early on and stagnates from then on.

Training History:

Performance Report / Recall normalized confusion matrix
