

Model name: 3d_efficientnetb1_dense128

Description and underlying idea:

This is a first modelling approach with an EfficientNetB1 base-model. The dense-layers were chosen in the form 1024 -> 128 -> 4 because, as seen, this has proven to be an improvement.

Conclusion:

Although the results are quite good, the model performs poorly when tested on other random pictures from the Internet. We can also see some overfitting from the training history.

Training History:
