

Model name: 4_50ep_medparam_4xconv2d_dense128

Description and underlying idea:

This model is the same as 4_25ep_medparam_4xconv2d_dense128, however we let again run the training for another 25 epochs with an even more reduced learning rate down to $1e-6$.

Conclusion:

For a simple baseline model, which has never seen images, it performs quite good. However, we can clearly see from the gap between accuracy on train and validation dataset, that the model has overfitted a lot.

Training History:

Performance Report / Recall normalized confusion matrix
