

Model name: 4_preproc_vgg16retrained_dense128

Description and underlying idea:

In this model, we included the VGG16 preprocessing into the model, so that the model can be applied to x-ray images directly. The model was then trained on all layers including the underlying VGG16 pretrained model.

Conclusion:

The performance of the model is quite good. Training and validation accuracy are similar, so there is not much overfitting.

Training History:
